

honeybees are essential

USDA Does Critical Honey and Honeybee Data Collection and Research

When bee populations collapse, farmers lose income and food prices rise.

Scientists at USDA's Bee Research Laboratory (BRL at BARC) investigate and test solutions to problems flagged by National Agricultural Statistics Service (NASS) data (-28% production decline, increased colony losses, varroa mite spread).

The NASS Honey survey tracks how much honey is harvested, how many colonies are producing it, and at what price. Quarterly Honey Bee Colonies data reveals when bee colonies are failing. Cost of Pollination data shows what's at stake: \$6.4B in crops annually.
